Description

Pyridine-2,4- and -2,5-dicarboxamides and their derivatives, process for their preparation, and their use

5 Compounds which inhibit the enzymes proline hydroxylase and lysine hydroxylase cause a highly selective inhibition of collagen biosynthesis by affecting the collagen-specific hydroxylation reactions. During these reactions, protein-bound proline or lysine is hydroxylated by the
10 enzymes proline hydroxylase and lysine hydroxylase, respectively. If this reaction is prevented by inhibitors, the result is a non-functional, subhydroxylated collagen molecule, of which only a small amount can be released from the cells into the extracellular space. Moreover, the
15 subhydroxylated collagen cannot be incorporated into the collagen matrix and is subject to very rapid proteolytic degradation. As a consequence of these effects, the total amount of extracellularly deposited collagen decreases.

It is known that inhibition of proline hydroxylase by
20 known inhibitors, such as α,α' -dipyridyl, results in an inhibition of the Cl_q biosynthesis of macrophages (W. Müller et al., FEBS Lett. 90 (1978), 218; Immunobiology 155 (1978), 47). The classical pathway of complement activation is therefore not available. Proline
25 hydroxylase inhibitors therefore also act as immunodepressants, for example in immune complex disorders.

It is known that the enzyme proline hydroxylase is inhibited effectively by pyridine-2,4- and -2,5-dicarboxylic acid (K. Majamaa et al., Eur. J. Biochem. 138
30 (1984) 239-245). When these compounds are used in cell cultures, however, they only act as inhibitors when present in very high concentrations (Tschanck, G. et al., Biochem J. 238 (1987) 625-633).

DE-A-3,432,094 described pyridine-2,4- and -2,5-dicarboxylic acid diesters having 1-6 carbon atoms in the ester alkyl moiety as pharmaceuticals for inhibiting proline hydroxylase and lysine hydroxylase.

5 However, the shortcoming of these lower-alkylated diesters is that they are too rapidly cleaved in the organism to give the acids, and that they do not reach the site of action in the cell in sufficiently high concentrations, which makes them less suitable for
10 possible administration as pharmaceuticals.

DE-A-3,703,959, DE-A-3,703,962 and DE-A-3,703,963 provide the general description of mixed ester/amides, higher alkylated diesters and diamides of pyridine-2,4- and -2,5-dicarboxylic acid which are efficient inhibitors of
15 collagen biosynthesis in the animal model.

For example, DE-A-3,703,959 describes, inter alia, the synthesis of N,N'-bis(2-methoxyethyl)pyridine-2,4-dicarboxylic diamide and N,N'-bis(3-isopropoxypropyl)-pyridine-2,4-dicarboxylic diamide.

20 German Patent Applications DE-A-3,826,471 and DE-A-3,828,140 propose an improved process for the preparation of N,N'-bis(2-methoxyethyl)pyridine-2,4-dicarboxylic diamide. German Patent Application DE-A-3,924,093 proposes novel N,N'-bis(alkoxyalkyl)-
25 pyridine-2,4-dicarboxylic diamides.

There was a need to search for other compounds having an improved pharmacological activity with regard to the inhibition of lysine hydroxylase and proline hydroxylase.

30 Surprisingly, it has now been found that this object is achieved by the following pyridine-2,4- and -2,5-dicarboxylic diamides.

The invention therefore relates to compounds of the formula I

The invention furthermore relates to a process for the preparation of compounds of the formula I which comprises reacting

5 a compound of the formula IV

with a compound of the formulae V

10 where R^1 , R^2 or R^3 , R^4 are as defined in formula I and Y is halogen or hydroxyl or together with the carbonyl group forms an active ester or a mixed anhydride, and, if appropriate, converting the reaction products into their physiologically acceptable salts.

15 The preparation of compounds of the formula I and the preparation of the starting materials required therefor, unless they are commercially available, will be described hereinafter in greater detail.

20 The simplest way of preparing the compounds according to the invention is to combine the two components, the pyridine derivative of the formula (IV) and the amine of

the formula (V), in equimolar amounts or in up to approximately 5-fold excess of V, and to react them at temperatures of between -30 and 150°C, preferably at 20 to 100°C, until the reaction is complete. The end of

5 the reaction can be determined by means of thin-layer chromatography (DC check). In a variant of this process,
10 the reaction is carried out in a suitable solvent such as diethyl ether or dimethoxyethane or tetrahydrofuran, chlorinated hydrocarbons such as methylene chloride, chloroform, tri- or tetrachloroethylene, benzene, toluene or else polar solvents such as dimethylformamide or acetone or dimethyl sulfoxide.

In this process too, an excess of amine of the formula (V), which can be up to approx. 5-fold, can be used. The
15 reaction temperatures are between room temperature and the boiling point of the solvent, temperatures in the range from room temperature to 130°C being particularly preferred.

20 The reaction can equally be carried out via a mixed anhydride such as ethyl chloroformate, or via an activated ester such as paranitrophenyl ester ($\text{Y} = \text{C}_6\text{H}_4-\text{COO}$ or $\text{NO}_2-\text{C}_6\text{H}_4-\text{O}$). Suitable methods can be found in Houben-Weyl, Methoden der Organischen Chemie [Methods in Organic Chemistry], Volume XV/2, pages 169 to 183 (mixed anhydride method), or pages 13 et seq. (active ester method),
25 fourth edition, Georg Thieme Verlag, Stuttgart 1974.

If appropriate, the reaction can also be carried out in the presence of bases. Suitable additional bases are inorganic acid scavengers such as carbonates or hydrogen-
30 carbonates, for example sodium carbonate, potassium carbonate, sodium hydrogencarbonate or potassium hydrogencarbonate, or organic acid scavengers such as tertiary amines, such as triethylamine, tributylamine, ethyl diisopropylamine or heterocyclic amines such as
35 N-alkylmorpholine, pyridine, quinoline or

dialkylanilines.

The compounds of the formula (IV) are preferably reacted with amines of the formula (V) with addition of a water-eliminating agent such as dialkylcarbodiimide, where the 5 alkyl radicals have 1 to 8 carbon atoms which, in the case of the C₃-C₈-compounds, can also be branched or cyclic; dicyclohexylcarbodiimide is preferably employed. A suitable method is described in Houben-Weyl Volume 10 XV/2, pages 103 to 111, Methoden der Organischen Chemie [Methods in Organic Chemistry], 4th Edition, Georg Thieme Verlag, Stuttgart, 1974.

If appropriate, the products can be worked up for example by extraction or by chromatography, for example using silica gel. The isolated product can be recrystallized 15 and, if appropriate, reacted with a suitable acid to give a physiologically acceptable salt. Examples of suitable acids are:

Mineral acids such as hydrochloric and hydrobromic acid as well as sulfuric acid, phosphoric acid, nitric acid or 20 perchloric acid, or organic acids such as formic acid, acetic acid, propionic acid, succinic acid, glycolic acid, lactic acid, malic acid, tartaric acid, citric acid, maleic acid, fumaric acid, phenylacetic acid, benzoic acid, methanesulfonic acid, toluenesulfonic acid, 25 oxalic acid, 4-aminobenzoic acid, naphthalene-1,5-disulfonic acid or ascorbic acid.

If the starting compounds of the formula (V) are not commercially available, they can be synthesized in a simple manner (for example Organikum, Organisch 30 Chemisches Grundpraktikum [Practical Foundation in Organic Chemistry], 15th Edition, VEB Deutscher Verlag der Wissenschaften, 1976; a survey of the various possibilities can be found in the methodological register, page 822).

For example, the starting compound of the formula (IV) can be obtained by reacting pyridine-2,4- or -2,5-dicarboxylic acid to give the corresponding pyridine-2,4- or -2,5-dicarboxylic halide, preferably the chloride (by processes known from the literature, for example Organikum, Organisch Chemisches Grundpraktikum [Practical Foundation in Organic Chemistry], 15th Edition, VEB Deutscher Verlag der Wissenschaften, 1976, page 595 et seq.), which is then reacted with a suitable alcohol, for example paranitrobenzyl alcohol, to give the corresponding active ester. Equally, the pyridine-2,4- or -2,5-dicarboxylic acid can also first be converted into a mixed anhydride by addition of a suitable carboxylic acid or carboxylate, such as ethyl chloroformate, and this mixed anhydride is then reacted with the amines (V) to give the products according to the invention. A suitable method is described, for example, in Houben-Weyl, Methoden der Organischen Chemie [Methods in Organic Chemistry], Volume XV/2, pages 169 to 183, 4th Edition, 1974, Georg Thieme Verlag Stuttgart.

The compounds of the formula (I) according to the invention have valuable pharmacological properties and are, in particular, effective as inhibitors of proline hydroxylase and lysine hydroxylase, as a fibrodepressant, immunodepressant and antiatherosclerotic.

The antifibrotic action can be determined with the aid of the carbontetrachloride-induced hepatic fibrosis model. To this end, rats are treated twice weekly with CCl₄ (1 ml/kg) dissolved in olive oil. The test substance is administered daily, if appropriate even twice daily, orally or intraperitoneally, dissolved in a suitable acceptable solvent. The extent of hepatic fibrosis is determined histologically and the amount of collagen in the liver is analysed by hydroxyproline determination as described by Kivirikko et al. (Anal. Biochem. 19, 249 et seq. (1967)). The fibrogenetic activity can be determined

by radioimmunological determination of collagen fragments and procollagen peptides in the serum. In this model, the compounds according to the invention are active at a concentration of 1-100 mg/kg.

- 5 The fibrogenetic activity can be determined by radioimmunological determination of the N-terminal propeptide of the type III collagen or the N- or C-terminal cross-linking domain of the type IV collagen (7s collagen or type IV collagen NC₁) in the serum.
- 10 To this end, the concentration of hydroxyproline, procollagen III peptide, 7s collagen and type IV collagen NC in the liver were measured in
 - a) untreated rats (control),
 - b) rats who had been administered carbon tetrachloride (CCl₄, control) and
 - c) rats who had been administered first CCl₄, followed by a compound according to the invention (this test method is described by Rouiller, C., Experimental toxic injury of the liver; in The Liver, 20 C. Rouiller, Vol. 2, pages 335-476, New York, Academic Press, 1964).

Another model for evaluating the antibiotic action is that of bleomycin-induced pulmonary fibrosis as described by Kelley et al. (J. Lab. Clin. Med. 96, 954, (1980)).

- 25 The cotton ball granuloma model, as described by Meier et al., Experimentia 6, 469 (1950), can be used for evaluating the action of the compounds according to the invention on the granulation tissue.

- 30 The compounds of the formula I can be used as medicaments in the form of pharmaceutical preparations which comprise the compounds of the formula I if appropriate together with acceptable pharmaceutical excipients. The compounds can be used as drugs, for example in the form of pharmaceutical preparations, which comprise these compounds in

the form of a mixture with a pharmaceutical, organic or inorganic excipient which is suitable for enteral, percutaneous or parenteral administration such as, for example, inter alia, water, gum arabic, gelatine,
5 lactose, starch, magnesium stearate, talc, vegetable oils, polyalkylene glycols and vaseline.

To this end, they can be administered orally at dosage rates of 0.1-25 mg/kg/day, preferably 1-5 mg/kg/day, or parenterally at dosage rates of 0.01-5 mg/kg/day, preferably 10 0.01-2.5 mg/kg/day, in particular 0.5-1.0 mg/kg/day. In severe cases, the dosage rates can also be increased. In many cases, however, lower dosage rates suffice. These data are based on an adult person of a body weight of approximately 75 kg.

15 The invention furthermore comprises the use of the compounds according to the invention in the preparation of pharmaceuticals which can be employed for the treatment and prophylaxis of the metabolic disorders mentioned above.

20 A further object of the invention are pharmaceuticals comprising one or more compounds of the formula I according to the invention and/or physiologically acceptable salts thereof.

25 The pharmaceuticals are prepared by processes which are known per se and familiar to a person skilled in the art. As pharmaceuticals, the pharmacologically active compounds (= active substance) according to the invention are employed either as such or, preferably, in combination with suitable pharmaceutical adjuvants or excipients
30 in the form of tablets, coated tablets, capsules, suppositories, emulsions, suspensions or solutions, the active substance content being up to approximately 95%, advantageously between 10 and 75%.

Suitable adjuvants or excipients for the desired pharmaceutical formulation are, besides solvents, gelling agents, bases for suppositories, tabletting adjuvants and other active substance excipients, for example also 5 antioxidants, dispersants, emulsifiers, defoamers, flavor improvers, preservatives, solubilizers or colorants.

Analogously to Example 8 from dimethyl pyridine-2,4-di-5 carboxylate and tyramine

colorless crystals, m.p. 165-166°C

Empirical formula: C₂₃H₂₃N₃O₄ (405)

MS: m/e = 40 (M + H⁺)

Example 164

Bis(N-Methoxy-N-methyl)pyridine-2,4-dicarboxamide

5.1 g (40 mmol) of N-ethylmorpholene are added at 20°C with stirring to 1.67 g (10 mmol) of 2,4-pyridinedi-
5 carboxylic acid, suspended in 100 ml of dichloromethane, 2.9 ml (20 mmol) of isobutyl chloroformate are subsequently added dropwise at -15°C, and the mixture is stirred for 20 minutes at -10°C. 1.95 [lacuna] (20 mmol) of N,O-dimethylhydroxylamine hydrochloride are then
10 added, the mixture is stirred for 1 hour at -15°C and allowed to come to 20°C overnight, water is added, the mixture is extracted with dichloromethane, and, after purification of the crude product by column chromatography over silica gel (ethyl acetate/methanol = 10/1),
15 1.6 g of the title compound are obtained as a colorless oil,

Empirical formula: C₁₁H₁₅N₃O₄ (253)

MS: m/e = 254 (M + H⁺)

Example 165

20 2-N- -Methoxyethyl)-4-N-(ethyloxy(N-tert.butyloxy-carbonylglycyl)pyridine-2,4-dicarboxamide

0.8 g (3 mmol) of 2-N-(2-methoxyethyl)-4-N-(2-hydroxyethyl)pyridine-2,4-dicarboxamide (compound of Example 6d) is combined with 25 ml of anhydrous acetonitrile and
25 525 mg (3 mmol) of N-butyloxycarbonylglycine, 0.4 ml (3 mmol) of N-ethylmorpholine, 0.45 g (3.3 mmol) of N-hydroxybenzotriazole and 0.62 g (3 mmol) of N,N-di-cyclohexylcarbodiimide, and the mixture is stirred for 20 hours at 25°C. The resulting N,N-dicyclohexylurea is
30 filtered off with suction, washed with acetonitrile and concentrated, the product is taken up in dichloromethane, the mixture is extracted with saturated aqueous NaHCO₃ solution, the extract is shaken with 10% strength aqueous

citric acid, dried and freed from solvent, and the residue is chromatographed over silica gel.

Empirical formula: C₁₉H₂₈N₄O, (424)

MS: m/e = 425 (M + H⁺)
